LIFO LOOKOUT

September 2007

LIFO UPDATE

If you had called me personally to ask "What's happening lately with LIFO that I need to know about?"... Here's what I'd say:

#1. IRS TAM ON COST CAP FOR DEALERS WILL IMPACT DEALERS' LIFO CALCULATIONS.

The inventory cost capitalization rules in Section 263A apply to all taxpayers with average annual gross receipts of \$10 million or more. On September 7, 2007, the IRS released a Technical Advice Memorandum in which it set forth several controversial interpretations relating to how these cost capitalization rules should be applied to the fairly complex service, repair and body shop operations of an automobile dealership.

This quarter's issue of the *Dealer Tax Watch* was devoted to an analysis of TAM 200736026, and it included *Can Your Dealership Get a Better Cost Cap Result?* as a *Practice Guide*.

Many auto dealers are looking at massive potential Section 481(a) adjustments ... hundreds of thousands of dollars ... as the IRS' interpretations in this TAM are being applied to dealerships across the country. What's more ... there are several very important issues relating to how automobile dealers using the LIFO method to value their inventories will be affected.

Unfortunately, the IRS did not address these LIFO implications. And, some of them remain to be more fully developed and could require restatement of the historical LIFO cost layers that make up a dealership's LIFO reserves. We will be reporting on these LIFO implications in a subsequent issue of the *Lookout*.

#2. REBASING LIFO INDEXES TO 1.000 AFTER CHANGES IN LIFO METHODS. To the extent that you are involved with LIFO elections over any extended period of time, you are likely to encounter situations where it is necessary to rebase the LIFO indexes to 1.000 after a change in LIFO method has been made.

Sometimes this rebasing is necessary in connection with "automatic" changes in LIFO methods; sometimes it is required in connection with the LIFO changes that require advance approval from the IRS. In other cases, rebasing occurs after businesses merge and it is necessary to combine their LIFO pools.

Rebasing of LIFO indexes is an important, but sometimes misunderstood, process. For more information on this, see page 2.

#3. THE DISADVANTAGE OF THE IPIC METHOD FOR AUTO DEALERS ... A CASE STUDY

BASED ON OUR EXPERIENCE. In our last issue of the *Lookout*, we took an in-depth look at the Inventory Price Index Computation (IPIC) LIFO Method. We examined many aspects of the IPIC method and the finer points of the various sub-elections that have to be considered.

We also specifically addressed the (potential) applicability of the IPIC LIFO method to auto dealerships' new vehicle inventories. In this context, our analysis in the June *Lookout* included several comparisons of the cumulative inflation results under the IPIC Method with the Alternative LIFO Method. Our comparisons in the June issue only took into

REBASING INDEXES TO 1.000 AFTER CHANGES IN LIFO METHODS

MANY COMMON LIFO METHOD CHANGES REQUIRE REBASING

When businesses using the LIFO method voluntarily change from one method to another LIFO method, they are often permitted to avoid the recapture of any part of their LIFO reserves. In these circumstances, they are permitted to use the cut-off method, and this avoids the computation of a Section 481(a) adjustment to account for the financial impact of the change in method.

To the extent that you are involved with LIFO elections over any extended period of time, you're likely to encounter these situations. One common example of where the cut-off method is generally permitted, and the LIFO indexes are rebased to 1.000, involves changes from the double-extension LIFO method to a link-chain (index) method.

Another common example involving rebasing of indexes, but where the cut-off method was not permitted (i.e., a Section 481(a) adjustment was required), occurred when taxpayers (including many auto dealerships) elected to remove trade discounts and/or advertising costs from their year-end LIFO inventory costs.

Other changes in LIFO methods that result in the rebasing of indexes to 1.000 after the change are so-called "automatic" changes in method. These do not require the taxpayer to obtain permission in advance from the IRS. Examples of these changes include (1) changes from another LIFO method to the IPIC method and (2) changes by automobile dealers already using LIFO to either of the Alternative LIFO Methods for new vehicles (under Rev. Proc. 97-36) or for used vehicles (under Rev. Proc. 2001-23).

GUIDANCE FROM A RECENT REVENUE PROCEDURE

There are no official examples or illustrations in the Regulations under either Section 446 for accounting method changes or under Section 472 for LIFO method changes that show exactly how this rebasing is to be accomplished.

Rebasing of indexes to 1.000 seems to be a general requirement that the IRS National Office imposes when it issues its "consent" letters to taxpayers who must receive advance permission to make LIFO method changes. Also, in issuing several Revenue Procedures which established safe harbor LIFO calculation methodologies for automobile deal-

ership inventories, the IRS specifically made mandatory (1) the use of the cut-off method and (2) the rebasing of indexes to 1.000 after the change.

In Revenue Procedure 2001-23, the IRS states that in making the change to the new method, "any LIFO inventory cost increments previously determined and the LIFO value of such increments shall be retained. Instead of using the earliest taxable year for which the taxpayer adopted LIFO as the base year, the year of change must be used as the new base year in determining the value of all existing LIFO cost increments for the year of change and later taxable years." [Section 5.02(3)]

This Revenue Procedure further states that the cumulative index at the beginning of the year of change will be 1.000. "The base-year cost of all LIFO cost increments at the beginning of the year of change must be restated in terms of new base-year costs, using the year of change as the new base year, and the indexes for previously determined inventory increments must be recomputed accordingly."

The Revenue Procedure also makes the statement that the new base-year cost of the goods in a pool is equal to the total current-year cost of all the goods in the pool. This is another way of saying that the cumulative index at the end of the year before the year of change must be used as the conversion factor in determining the new total amount of base dollars.

There is no other guidance on rebasing procedures (other than similar language in Rev. Proc. 97-36) to be found in any other official sources.

GENERAL PRINCIPLES

The general principle underlying the rebasing requirement appears to be that the index for each year's increment is restated by creating a fraction, the numerator of which is the cumulative index for valuing that year's increment and the denominator of which is the cumulative index as of the end of the last year before the year of change. Then each year's LIFO valuation index or factor is multiplied by that fraction to reduce it to a decimal that is less than 1.000.

Since all prior year increments retain their same LIFO valuations in the rebasing process, this simply "forces" all of the prior indexes or valuation factors to be changed to become the quotients produced by dividing (A) the fixed/unchanged LIFO valuation amount for that year's layer by (B) the corresponding "grossed up" or "new" base dollar amount. This "new"

Rebasing Indexes...

base dollar amount, in turn, is determined as the product of multiplying (1) the "old" base dollar inventory amount for that year by (2) the deflator index that was used at the end of the last year under the old method to reduce that ending inventory at cost to its equivalent amount expressed in original base dollars.

LETTER RULINGS INVOLVING REBASING

LTR 8137143. Two IRS Letter Rulings offer some unofficial guidance. Technical Advice Memorandum (Letter Ruling) 8137143 (dated June 1981) indicates that when LIFO inventories are to be rebased, the key procedure involved is one whereby the LIFO indexes generated in years *before* the year of change are restated to indexes of less than 1.000, gradually rising or ascending according to the overall inflation pattern so that they reach (but do not exceed) 1.000 as of the beginning of the year of the change, while retaining their percentage relationships to each other year-by-year in the restatement.

Letter Ruling 8137143 involves computations for splitting one pool into several dollar-value LIFO pools. Therefore, the facts in that Ruling are somewhat involved and make it more difficult to see what is actually supposed to happen.

LTR 8008012. The rebasing situation in LTR 8008012 is more straightforward. This LTR states: "In changing to the link-chain method without performing a recomputation of the LIFO value of the inventory at the beginning of the year of change under the link-chain method, it is necessary for the ratios of costs in layers added prior to the year of change to be computed in their relationship to the new base year costs rather than the old base year costs."

It adds, "For this purpose, an appropriate index to base (*i.e.*, to determine) costs for each layer added prior to the year of change would be the ratio of the LIFO value of such layer to the base cost of the layer. The LIFO value of the inventory is not changed and the total of the new base year costs is treated in the same manner as the old base year costs; that is, used solely for the purpose of determining whether there has been an increase or a decrease in the inventory value, and as a basis for determining the value of such increase or decrease.

"For example, if in a taxable year subsequent to the year of change, a decrease in inventory at base costs were to occur, the decrease in inventory at base costs would be applied to reduce the value of the successive layers of increment in reverse chronological order. If the layer being reduced was added in the year of change or in a taxable year subsequent thereto, the cumulative index for the year of the layer

(Continued)

would be applied to the decrease in base costs to determine the amount of reduction in the layer. If the year the layer was added was a year prior to the year of change, the index of the LIFO value of the layer to base cost of the layer would be used to determine the portion of the LIFO value of the layer equivalent to the reduction at base costs.

"Since permission to use the link-chain method is granted only when one of the base year cost methods is impractical or unsuitable, the indexes used prior to the change are not suitable. In order to obtain a good basis for future computations of the cumulative indexes, it is necessary to establish a new base year. The LIFO value of the inventory prior to the change remains unchanged and the purpose of the new base year cost is to establish a basis for determining future increments or decrements."

SPECIAL PROBLEMS WHERE A DUAL INDEX LIFO METHODOLOGY HAS BEEN USED

Various factual patterns will present difficulties in interpretation and application, especially where a dual index (or "earliest acquisition") approach may have been elected for valuing increments.

Where dual indexes or earliest acquisitions methods have been used for valuing annual LIFO increments, the key to understanding the rebasing is this: You should incorporate the cumulative index factor that was used to deflate the ending inventory to base dollars at the end of the last year under the old method somewhere into the rebasing schedule so that it will stand out as the principal reference point. That cumulative index factor is the factor that must be used as the denominator in the rebasing fraction by which prior years' layers of base dollars are multiplied.

Sometimes, the cumulative index as of the beginning of the year of change may not be 1.000 ... instead, it may be a decimal less than 1.000. In other situations, the rebasing results may depend on whether a strict or literal interpretation focuses on the amount of costs at the "beginning of the year of change" or on the costs in the last year prior to the year of change (more generally) as the critical denominator in the recomputation of indexes.

HOW TO DOUBLE-CHECK LIFO CALCULATIONS AFTER INDEXES HAVE BEEN REBASED

As a result of the rebasing process, there should be no change (either increase or decrease) in the amount of the LIFO reserve. In other words, the LIFO reserve before the rebasing procedure should be the same amount as the LIFO reserve after the rebasing is completed.

see REBASING INDEXES..., page 4

Rebasing Indexes...

The intention underlying the requirement is simply to provide a means or mechanism to more accurately keep track of increments and layers **before** the year of change when a decrement in the inventory is experienced after the year of change, and that decrement is required to be carried back against the appropriate prior years inventory layers expressed in base dollars. Therefore, there should not be a major difference in result where indexes are rebased to 1.000.

Where the prior LIFO method was a link-chain method, there is a way to double check the LIFO computations after they are rebased, especially where a subsequent decrement is experienced.

All you have to do is to recompute the LIFO reserve changes as if the LIFO inventory layers had not been rebased to 1.000. The computed change in LIFO reserve should be the same amount regardless of whether or not the indexes have been rebased to 1.000.

A comprehensive illustration of this principle was included in a previous article (*Why LIFO Reserves Go Up Even though Inventory Levels Go Down & Despite Rebasing Indexes to 1.000 in Between*) in the September 2001 *LIFO Lookout*.

Our web site (www.defilipps.com) includes a listing of all previous articles on rebasing in the *LIFO Lookout* Index of Articles. Other discussions are included in an article in *The Tax Advisor*, July, 1991, at pages 447-451 and in the AICPA Issues Paper: *Identification and Discussion of Certain Financial Accounting and Reporting Issues Concerning LIFO Inventories*, dated November 30, 1984 (File 3175). This important LIFO document contains a discussion of substitute base years on pages 26-27 and illustrates an application for a double-extension LIFO taxpayer on pages 97-98.

(Continued from page 3)

A SIMPLE EXAMPLE OF REBASING

In reviewing the accompanying example, it should be noted that the respective amounts of the LIFO valuations for the base inventory and for each of the remaining increments do not change. The total LIFO valuation of the inventory (\$1,589,349) has not changed in the process. It should also be noted ... and this very important ... that the LIFO reserve of \$814,649 and each element of the composition and proof of the LIFO reserve as of Dec. 31, 2006 show exactly the same amount of respective contribution to the LIFO reserve for each layer **before** and **after** the rebasing of the indexes to 1.000.

Through the rebasing procedure, a new base year (i.e., 2007, the first year for which the new LIFO Method will be used) is created solely for computation purposes. Under this procedure, the original or oldest base year (i.e., 1996) and all of the other layers of increment experienced before the year of change (i.e., before the new or substitute base year) are restated in terms of the new base year levels.

The cumulative index as of the end of the last year before the year of change (i.e., the cumulative index as of Dec. 31, 2006) of 1.739660 becomes the conversion factor by which all of the base dollars for each layer are multiplied.

Assume that the inflation rate is 6% for the year 2007 (i.e., the first year of the use of the new LIFO method for which the inventory was rebased as of Dec. 31, 2006/Jan. 1, 2007). Since the cumulative inflation rate as of Dec. 31, 2006 has been rebased to 1.000, the cumulative inflation rate as of the end of the first year (i.e., Dec. 31, 2007) will be 1.0600 [1.0000 x 1.0600].

A CASE STUDY SHOWING THE DISADVANTAGE OF THE IPIC LIFO METHOD ... COMPARED TO THE ALTERNATIVE LIFO METHOD ... FOR AUTOMOBILE DEALERSHIPS

In our last issue of the *Lookout*, we took an in-depth look at the Inventory Price Index Computation (IPIC) Method. After examining many aspects of the IPIC method and the finer points of the sub-elections which have to be made, we included a section that specifically addressed the IPIC method in the context of its (potential) applicability to auto dealership inventories that are valued using LIFO. At that time, we included several comparisons of the Alternative LIFO Method with the results from using the IPIC BLS Tables. However, these comparisons looked only at the last 3, 5 or 7 year periods ending with 2006.

More recently, we have selected a number of dealerships for whom we have done LIFO calculations ever since 1992 when the IRS safe harbor (Alternative LIFO Method) became available for new vehicles. We have analyzed the entire 15-year period for 21 dealerships shown in the summary table on the facing page.

DEALERSHIPS IN OUR CASE STUDY

For all of the dealerships reported in the summary table, we have complete information concerning their

inventory detail and LIFO computations for the last 15 years ... all of the years for which the Alternative LIFO Method has been used.

Manufacturers & makes. Out of the 21 dealerships, 10 are GM ... 3 are Ford ... 3 are Toyota ... and the other 5 included BMW, Lexus, Mazda, Mitsubishi and one with miscellaneous imports. The entire group is representative of many, many other dealerships for whom we have performed LIFO calculations for long periods of time (10 or 12 years) but not for the entire 15-year period.

Five of these dealerships did not have new light-duty trucks in their second pool under the Alternative LIFO Method until some year after 1992. Therefore, cumulative inflation indexes for trucks for these dealerships are not reported in the table.

Geographic location. The geographic location of these dealerships is also indicated in the summary table. From this, it can be seen that 4 are West coast locations (principally in California), 6 are located in

see IPIC CASE STUDY, page 18

IPIC Case Study

the Midwest, and 11 are located in the East (some northeast and some southeast).

Changes from C to S. Out of the group in the summary, over this 15-year period of time, several of these dealerships had elected to be taxed as S Corporations. With respect to these dealerships that changed from C to S, we, of course, did not have to adjust the cumulative inflation indexes to reflect the fact that as of the last day of their last C Corp. year, they were required to repay their LIFO reserves. For these dealerships, the LIFO reserve reported in the summary schedule would have to be factored into the LIFO reserve as of the end of the last C year to get a better idea of their total LIFO reserve build-up over the 15-year period from 1992 through 2006.

Changes in LIFO methods. During the 15-year period, more than half of these dealerships made changes in their accounting method to remove trade discounts and/or advertising fees from their year-end inventory costs. The LIFO indexes for these dealerships were rebased to 1.000 in connection with these changes. We have adjusted the inflation indexes reported from 1992 through 2006 to show what they would have been had the rebasing not occurred. This adjustment permits a more accurate comparison of the cumulative inflation rates over the 15-year period.

(Continued from page 6)

SPECIFIC EXAMPLES

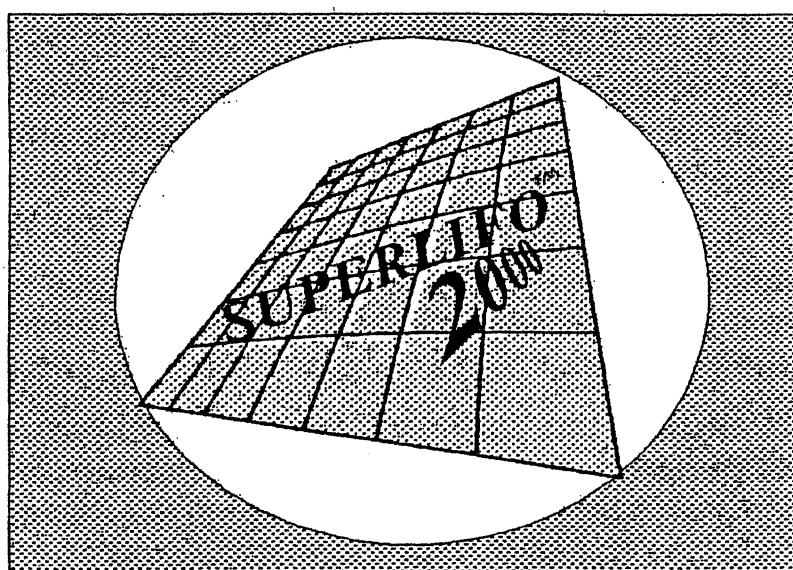

Out of the 21 dealerships, all of the information that was collected in the study for 3 of them is included on the following pages. This information will enable you to see the relative size of the inventories in terms of number of units and absolute dollars over the years. Other information is noted in the comment column.

CASE STUDY CONCLUSION

For auto dealerships, the results under the Alternative LIFO Method for New Vehicles were far, far better than they were under the IPIC Method. The cumulative inflation rates and indexes computed under the Alternative LIFO Method greatly exceed the inflation indexes computed for the corresponding 15-year period which would be derived from either Table 6 of the Producer Price Index (PPI) Reports or from Table 3 of the Consumer Price Index (CPI) Reports.

It is evident from the results reported for all of the dealerships on page 7 that the cumulative inflation amounts presented for the 15-year period are significantly greater under the Alternative LIFO Method than are the meager cumulative inflation rates that would be computed under either of the allowable IPIC BLS Tables. At this point, I don't believe that any more data would change this conclusion. *

COMPARISON OF **SUPERLIFO™** & IRS NEW ITEM DETERMINATIONS FOR NEW VEHICLES IN YEAR-END 2006 INVENTORIES

We are pleased to present our **SUPERLIFO™** 2007 New Items Lists in a Report comparing our determinations of new items with those previously made available by the office of the IRS Motor Vehicle Technical Advisor in Grand Rapids, Michigan.

The IRS lists were distributed with a cover letter dated January 22, 2007. In this letter, the IRS Motor Vehicle Technical Advisor states the following ...
"This list is similar to the guidance I provide to examiners who audit automobile dealers' Tax returns and is the result of research by my staff of the best information available to us. Since the list is not an 'Official List,' it does not reflect 'Service Position' and examiners are not required to follow it."

The IRS used the following sources to compile its New Items Lists... *Edmunds.com*, *Cars.com*, *NADAguides.com*, *Kelley Blue Book New Car Price Manual* (4th Edition, 2006 through 2nd Edition 2007), *Automobile Magazine*, *Automotive News*, and when available, product brochures, manufacturers' price lists and vehicle order guides.

HOW TO INTERPRET OUR **SUPERLIFO™** - IRS COMPARATIVE REPORT

Our Comparative New Item Report covers 25 pages. (Last year's comparison required 23 pages.) New automobiles are on pages 1 through 9; new light-duty trucks (including sport utility vehicles, minivans and off-roads) are on pages 10 through 25. An additional qualification added to the IRS Report states, **"This list is not intended for pooling purposes."**

Our Comparative New Item Report shows complete make, model, body style, model code and item category information.

The left-hand side of each Report page shows our **SUPERLIFO™** New Items List.

The right-hand side of the Report (including the "Yes" column) shows the IRS' Motor Vehicle Industry Specialist's new item listing.

To make it easier to identify the differences in our respective new items listings, where a *new* item on our List also appears on the IRS' list, that detailed item category has not been listed again on the right-hand side.

The "Yes/No" columns should be read as follows: If an "X" appears in the "Yes" column, that item

category has been determined by the IRS to be a *new* item category. Thus, every item category listed on the left-hand side of the page with a corresponding "X" in the "Yes" column indicates an item category where we are in agreement with the IRS.

Where there are blank spaces on the left-hand side of the page, but item category entries on the corresponding right-hand side of the page, you can clearly see those item categories (with model numbers) which the IRS concluded were new items, but which we concluded were not.

If an "X" appears in the "No" column, that item category is listed on the left-hand (i.e., **SUPERLIFO™**) side, and that "X" indicates an item category that we treated as *new*, but which the IRS did not.

The IRS also used a calendar year cut-off, rather than a model year cut-off, in compiling its list. This eliminated many items that otherwise might have been differences resulting from overlapping time periods. But in some instances, varying introduction dates created differences in our respective determinations.

In summary: Everything listed on the left-hand (our) side with an "X" in the "Yes" column is an item category where we agree with the IRS that it is a *new* item. Everything with an "X" in the "Yes" column is on the IRS' new item list. Everything listed on the right-hand (IRS) side of the page is an item category that the IRS considers to be *new* ... and we do not. Finally, everything with an "X" in the "No" column is something that we conclude should be a *new* item category, but the IRS does not.

With respect to the December 31, 2006 year-end vehicles, we identified a total of 973 new item categories (315 automobiles and 658 light-duty trucks) whereas the IRS identified a total of 491 (212 automobiles and 279 light-duty trucks). We both reached the same conclusion with respect to 439 new item categories.

We identified 534 item categories as *new*, but the IRS determined them to be *continuing*. The IRS identified 52 items as *new*, but we concluded that they should be treated as *continuing* items.

A table summarizing the details of these differences in treatment appears on page 21.

see NEW ITEM DETERMINATIONS, page 20

New Item Determinations

In general, this year, one of the differences arising in our analyses related to the manufacturer regional pricing for most of the Chrysler, Dodge and Jeep models. There is a different pricing (state surcharges that are included in dealer invoice base price for a number of states). The IRS only lists vehicles that do not include the states for which this special pricing exists. Our analyses reflected a total of 30 automobile items and 48 light-duty truck items that have differences due to regional pricing.

In some instances, we understand why we disagree with the IRS; in other situations, we're not quite sure why we don't agree - other than possibly because of conflicting information or timing differences in our respective resources.

In prior years' comparative lists, because of the format limitations involved in this side-by-side presentation, some of the new item vs. continuing item differences described as "due to timing" are not purely due to timing differences. Because we (i.e., *SuperLIFO™*) received the information sooner or more directly, some item categories were treated as new on an earlier compilation of new items ... and the IRS was simply catching up with treating them as new items on its "later" compilation.

In this year's comparative lists, information available to us for determining vehicle status was always (dated) earlier than the information the IRS was using for its determinations. This is clearly evident in the note at the bottom of page 21.

There are other instances involving models/vehicles that did not exist in the prior year where (1) we received information that the IRS did not, (2) we determined the item to be a new item, (3) the IRS did not even list that item (because the IRS did not have any information on it) and (4) that item appears in the "No" column and is "x'd" in the "No" column. The reason that these are not considered as timing differences between our respective lists is that the IRS had no information to evaluate. Therefore, that item will not result in a timing difference until, at some later date, the IRS receives information on the vehicle and then makes its determination as to its status.

(Continued)

DEFINITION OF A "NEW" ITEM

A *new item* category is defined as an item category not considered to be in existence in the prior taxable year.

Under Section 4.02(5) of Rev. Proc. 97-36, a new item category results from any one of the following:

- Any new or reassigned manufacturer's model code that was caused by a change in an existing vehicle,
- A manufacturer's model code created or reassigned because the classified vehicle did not previously exist, or
- If there is no change in a manufacturer's model code, but there has been a change to the platform (i.e., the piece of metal at the bottom of the chassis that determines the length and width of the vehicle and the structural set-up of the vehicle) that results in a change in track width or wheel base, whether or not the same model name was previously used by the manufacturer, a new item category is created.

NEW ITEM: WHAT DIFFERENCE DOES IT MAKE?

New item categories are required to be included at a 1.000 factor in the annual computation of the index of inflation or deflation. This is accomplished by using the same dollar amount for the end-of-the-year base cost as for the beginning-of-the-year base cost.

Since any number divided by itself equals 1.000, this new item treatment will contribute no inflation (or deflation) *for that item* to the annual index.

However, if there is overall inflation for the year, the inclusion of the same dollar amount for that new item in both the numerator and the denominator of the fraction will *reduce* the overall weighted index result (i.e., it will depress the index computed).

The opposite result occurs in an overall deflationary year. New item treatment (at 1.000) will *increase* the overall weighted index result if there would otherwise be overall deflation for the year. *

Out of the differences in Columns C & D, 24 cars and 253 truck differences were not "interpretive" differences. Rather, these 277 differences were solely due to timing in the sense that S/L and the IRS obtained the vehicle data in different time periods and therefore the vehicles did (or did not) appear on one list, but not on the other. In other words, these 277 "timing" differences would not exist if the comparison of lists were made over a 2 year period.

consideration the more recent 3, 5 or 7-year time periods ending with December 31, 2006.

As you know, we do LIFO calculations under the Alternative LIFO Method for many dealerships using our *SuperLIFO™* program. Since the June issue of the *Lookout*, we have selected several of these dealerships for whom we have done LIFO calculations ever since 1992 ... when the IRS' safe harbor (Alternative LIFO) method for new vehicles first became available.

We have reported the comparative results for several dealerships over this 15-year period of time in the table on page 7. These results should be sufficient to support our thesis that the advantages that dealers would have using the Alternative LIFO Method over the last 15 years are significant when compared to the meager results available under the IPIC method.

In my opinion, there is no doubt that, over this 15-year period of time, any dealership that had elected to use the IPIC LIFO Method (if it actually kept its election in effect through the end of 2006) would have significantly smaller LIFO reserves.

#4. MODEST INFLATION AHEAD FOR 2007 LIFO CALCULATIONS ... SO FAR. Our LIFO indexes for most dealership inventories basically reflected little, if any, inflation in the December 2006 year-end calculations. In general, for calendar year 2006, new auto pools reflected less than 1% inflation.

New light-duty truck pools reflected little, if any, inflation. In fact, most of these truck pools reflected indexes of 0.98, 0.99 or 1.000. That's deflation at a rate of 1% or 2% for most light-duty truck pools.

To date, for 2007, the information that we are seeing on price changes suggests that the year-end results will be about the same as they were last year. We will have more information and share it with you

in our 4th quarter issue, which should be in your hands in early December.

#5. COMPARISON OF IRS & SUPERLIFO "UNOFFICIAL" NEW ITEM DETERMINATIONS. Every year, we compare our *SUPERLIFO™* new item determinations with those published by the Office of the IRS Motor Vehicle Technical Advisor.

The last comparison, involving model years 2005-2006, appeared in the September 2006 *LIFO Lookout*. Our current comparison for the model year 2007 (and, in some cases, model year 2008) new items is based on the lists the IRS released earlier this year.

Our comparison schedules are set up so that you can see all of the vehicles which were treated as new items by the IRS, even if you don't care about how the IRS list compares with ours.

Our overview begins on page 19, and the detailed side-by-side comparisons for autos and for light-duty trucks follow on pages 23 through 47. As you can see, these lists get longer and more detailed every year.

Many CPAs and/or dealers are using service bureaus for their LIFO calculations. To this extent, they are relying on the new item determinations made by their service bureaus. Other CPA firms and dealerships still do their own new vehicle LIFO calculations on spreadsheets of their own creation, so they must be making these new item determinations each year for themselves.

A glance at the IRS lists (and ours) makes it clear that item category determinations are required to be detailed down to the most precise level of differentiation. Calculations cannot be based on rough averages of models or other generalized groupings that might be forthcoming from other shortcuts, such as downloading.

The *De Filips' LIFO Lookout* newsletter is a quarterly publication of LIFO News, Views and Ideas by Willard J. De Filips, CPA, P.C., 317 West Prospect Avenue, Mt. Prospect, IL 60056. It is intended to provide accurate, general information on LIFO matters and it should not be construed as offering accounting or legal advice or accounting or legal opinion on any specific facts or circumstances. The contents are intended for general information purposes only. Readers should consult their certified public accountant, attorney and/or other competent advisors to discuss their own situations and specific LIFO questions.
